## The Best is EDS!

**What Makes EDS Posts SO GREAT!?!?!**

EDS' parallel post design provides better retention, with less chance of vertical root fracture compared to tapered post design.

EDS's posts have the patented split-shank design which provides maximum retention of the post with minimal insertional stress on the root.

The split-shank closes upon insertion to deliver maximum retention with minimal stress. Removes all dentinal debris, enhancing ease of placement.

EDS's posts have the improved retention of a fully threaded post while keeping the minimal stress using a split-shank.

EDS' posts are available in a wide range of sizes and lengths for a more customized fit.

EDS' posts have the same features with the additional added bonus of a split-shank which reduces the insertional stresses of typical active posts.

EDS' active post provides more retention by engaging the dentin and reducing stress on the root by utilizing the split-shank design.

EDS' posts are active and reduce the chances for post debonding in the mouth.

EDS's pre-fabricated posts allow placement in one office visit.

Cuts into dentin rather than pushing it away.

EDS' posts heads are highly textured providing similar core retention to the IntegraPost with the addition of being an active post enhancing stability and retention
